XMLAW OneView™

One of the biggest challenges legal professionals face today is the massive amount of information they must collect, process and use in order to practice law and meet client expectations. Attorneys and other knowledge workers must have faster, easier access to the information they need from a growing list of sources, both inside and outside the firm. XMLAW's OneView provides a complete information management solution to solve the information overload problem.

OneView Connect

OneView Connect is a complete integration framework that brings together content and functionality from disparate applications and data sources into a secure, unified system. Built exclusively for SharePoint, it takes full advantage of the features and benefits of the SharePoint platform while seamlessly combining content and functionality from existing systems in a consistent, familiar interface. XMLAW provides dozens of pre-configured, pluggable connectors for commonly used law firm systems such as document management, customer relationship management and time and billing, in addition to configurable connectors for standard content sources such as relational databases, web services and even SharePoint-based information.

Built on proven XMLAW technology deployed at over 75 law firms totaling nearly 100,000 users, OneView Connect offers significant time and money savings when compared to other offerings or developing in-house solutions. It requires no additional coding or development, and can be deployed quickly.

OneView Connect helps legal professionals gain control over information, be more productive, and respond quickly to client demands.

OneView Search

OneView Search supports the way users work, whether they prefer searching or browsing for information. It securely crawls and indexes both structured and unstructured content from any data source, allowing users to easily find the information they need from multiple systems and content sources using SharePoint's powerful full-text search.

Unified searching across all law firm systems, including millions of documents stored in document management systems, allows users to stay within the intranet while searching all content sources. Interactive search results – with sorting, grouping and drill-down capabilities, navigation to related information, and contextual real-time integration with source system functionality – are customizable to the needs of the users.

Users will benefit from:

- Relevant and accurate results
- Basic and advanced search
- Customizable user interface
- Integrated Security
- Performance and scalability

OneView Extranet

OneView Extranet provides a secure location for attorneys and legal professionals to collaborate with clients on matters. Each client and matter can have a customized site, and any number of internal or external users can have access to the

site without compromising security. Attorneys can post documents for clients to check out, review, edit, approve, and check back in – the most widely used functionality of extranets. OneView Extranet also allows firms to include other functionality, and this functionality can be incorporated quickly without additional programming. Firms can offer clients the ability to review the number of hours that the firm has devoted to the matter, view total billings and gain access to the names and telephone numbers of all parties working on the matter.

Like OneView Connect, OneView Extranet provides IT professionals with the framework, application components, navigation components, data access and integration middleware, and site templates and configuration examples to make it easy to build and deploy client extranets. OneView Extranet streamlines the process for creating new client sites, creating user accounts, and assigning security. It also provides ongoing usage tracking, auditing, and reporting.

A Proven Platform

Built on SharePoint, Microsoft's fastest growing server product in its history, XMLAW's OneView products enable firms to connect to and deliver needed information, search data quickly and completely, and provide data and collaboration extranets to clients.

XMLAW's SharePoint-powered **OneView** products enable firms to **connect** to and present needed data, **search** data quickly and completely, and provide data and collaboration **extranets** to clients.

Learn how your firm can increase operational efficiency, boost productivity and improve client service with XMLAW's products and services.
